

Assignment - 05

Q1.

→ Bytes are a built-in data type used to store a sequence of binary data. Each element in a bytes object is an integer blwn 0 & 255.

Bytes are commonly used for:

- Reading & writing files.
- Network communication.
- Image, audio & video processing.

Bytes are immutable bcz once a bytes object is created, its contents cannot be changed.

- Better performance.

Q2.

→ Output: `b'ABC'` (ASCII values Acc.)

Q3.

→ feature	byte	bytearray
→ Mutability.	Immutable	Mutable
→ Modification	Cannot be modified	Can be modified
→ Performance	faster	Slower
→ Syntax	<code>b = bytes([65, 66, 67])</code>	<code>ba = bytearray([65, 66, 67])</code>
→ Use-Cases	Fixed binary data	Binary data that needs editing.

Q4.

→ `bytearray(b'abc')`

Q5.

→ None is a special constant in Python that represents the absence of a value | null value.
eg- `X = None`.

Q6.

→ Output : `<class 'NoneType'>`
`False`.

Q7.

→ The Boolean data type represents one of two values :
 · True
 · False.

Q8.

→ A set is an unordered collection of unique elements.

Characteristics :

- Stores only unique values.
- Does not maintain insertion order
- Mutable.
- Does not allow duplicate elements.

eg- `s = {10, 20, 30}`
`print(s)`

Q9.

→ Output : `{10, 20, 30}`

Q10.

→ Python is dynamically typed lang. as we don't need to declare data type of a variable.
